SPATIAL DATA

Content

UTM ONLINE LEARNING

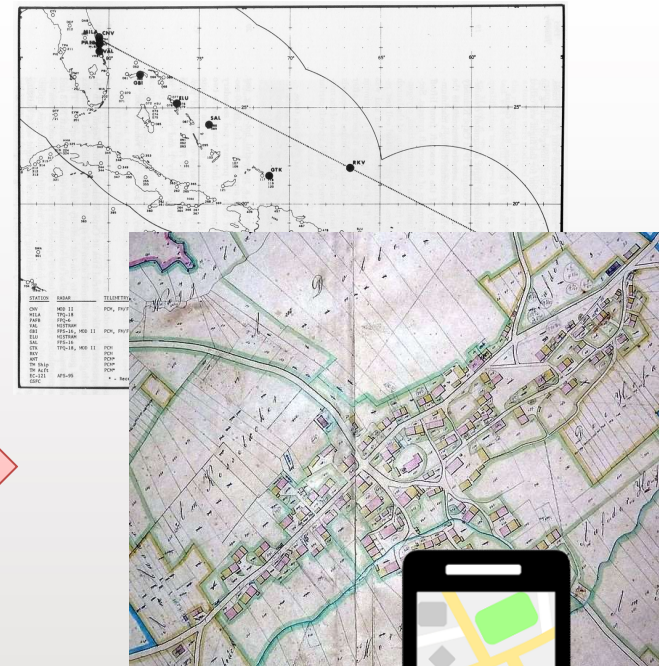

INTRODUCTION

Spatial data: Introduction

- Why spatial data is important?

why?
 how? who?
 WHEN?
 Where?

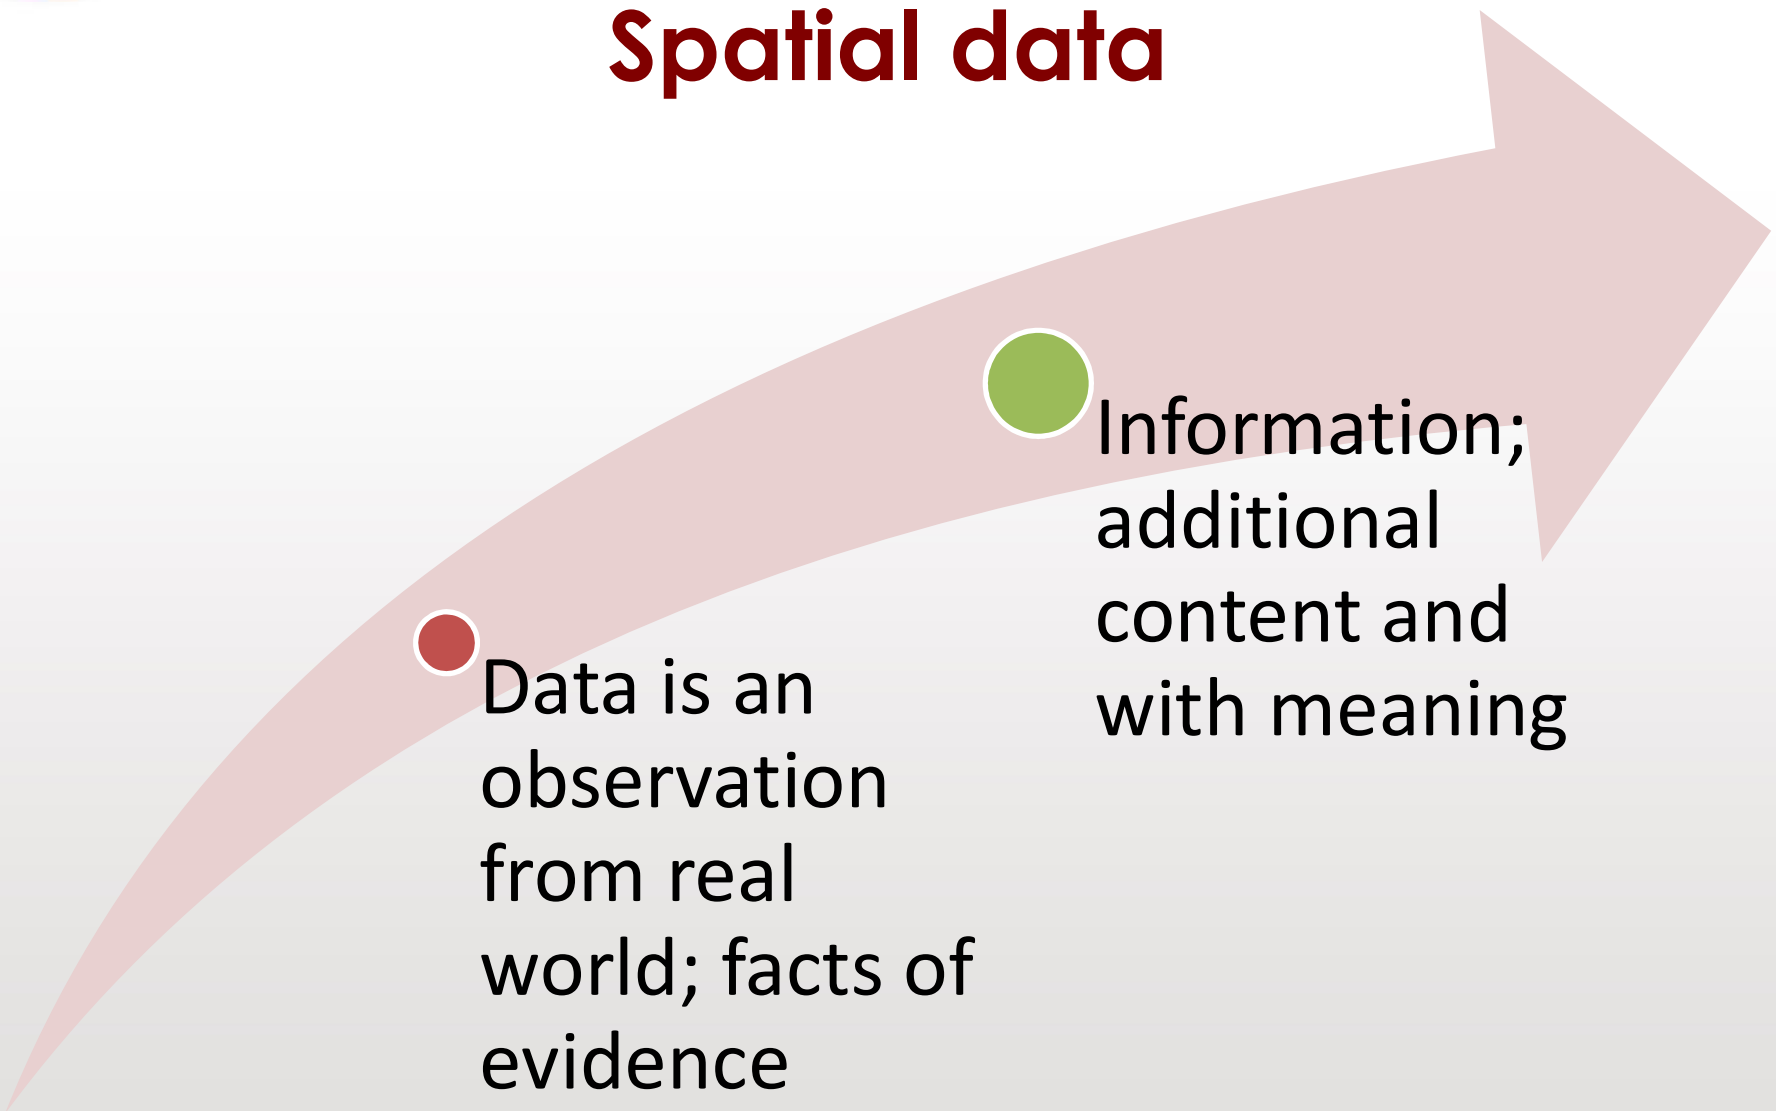

Some questions to ponder;

- How to show?
- How to model it?
- What the characteristic to view?
- What map projection to use?
- What the different methods of spatial referencing?
- What is topology?
- What the main source of spatial data?

Spatial data

● Data is an observation from real world; facts of evidence

● Information; additional content and with meaning

Cont... Spatial Data

- Two type of spatial data;

Primary;

collected first
hand

Secondary;

collected by
other
parties/person

Cont... Spatial Data

Temporal:

involved
with time

Thematic:

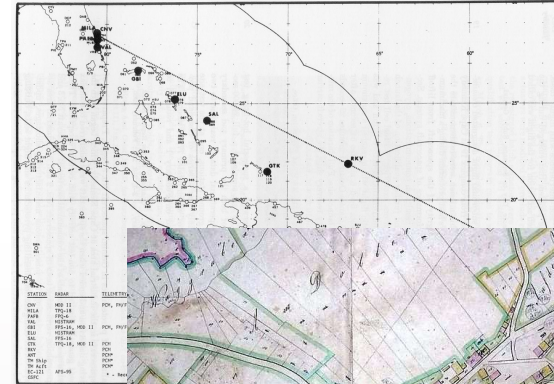

what
happen,
spatial
and
attribute

Spatial:

location
of the
data

why?
how? who?
WHEN?
Where?

How to model? What methods needed?

UTM ONLINE LEARNING

MAPS AND IT INFLUENCE TO THE CHARACTER OF SPATIAL DATA

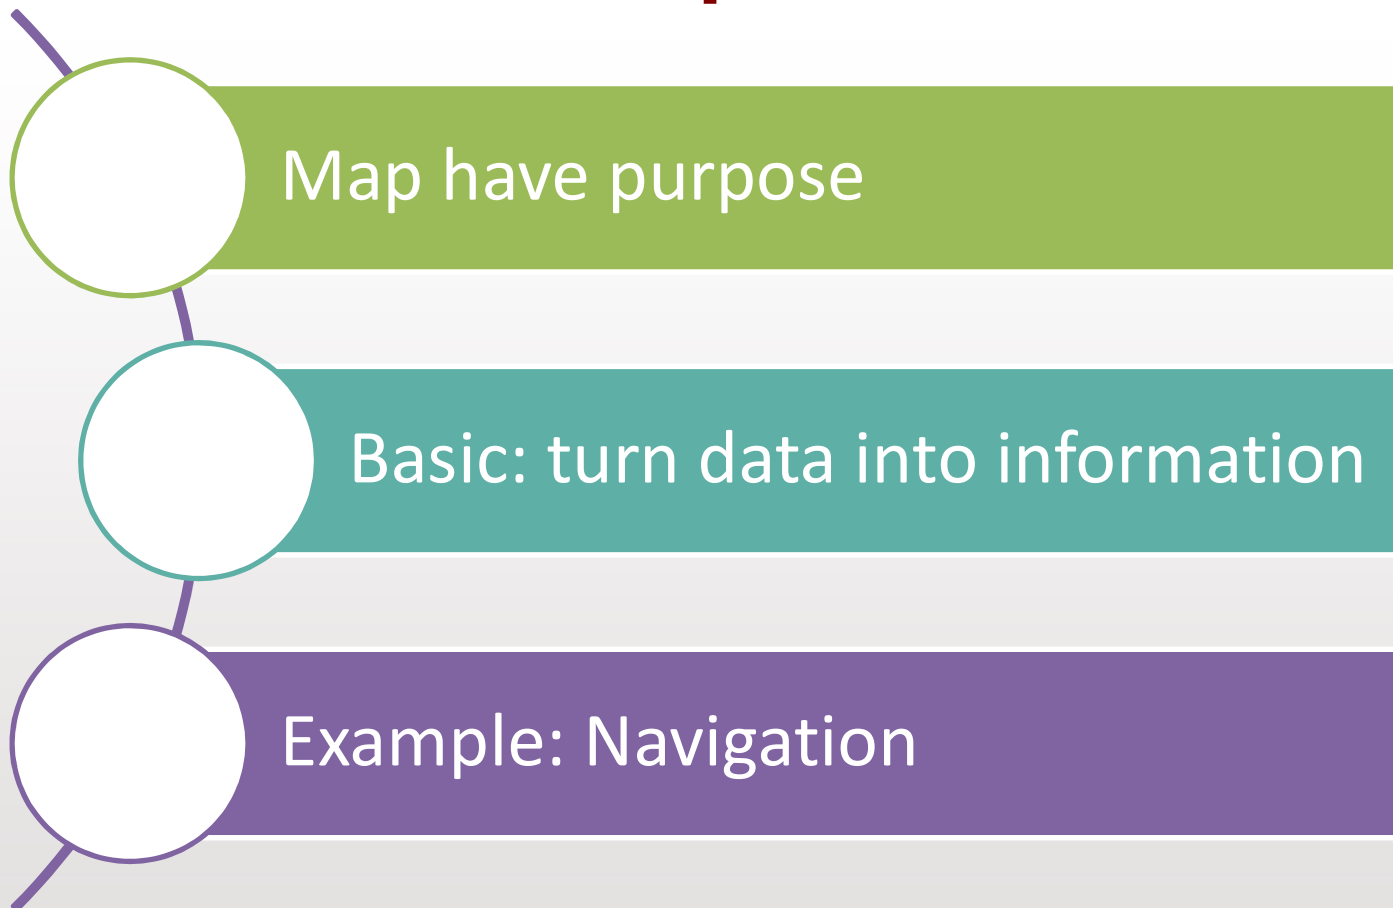

Maps and spatial data

- **Traditionally, GIS was based on maps.**

Maps and spatial data;

1. Purpose

Maps and spatial data;

2. Scale

Device smaller than real world

Scale: will help to “squish” world to our device

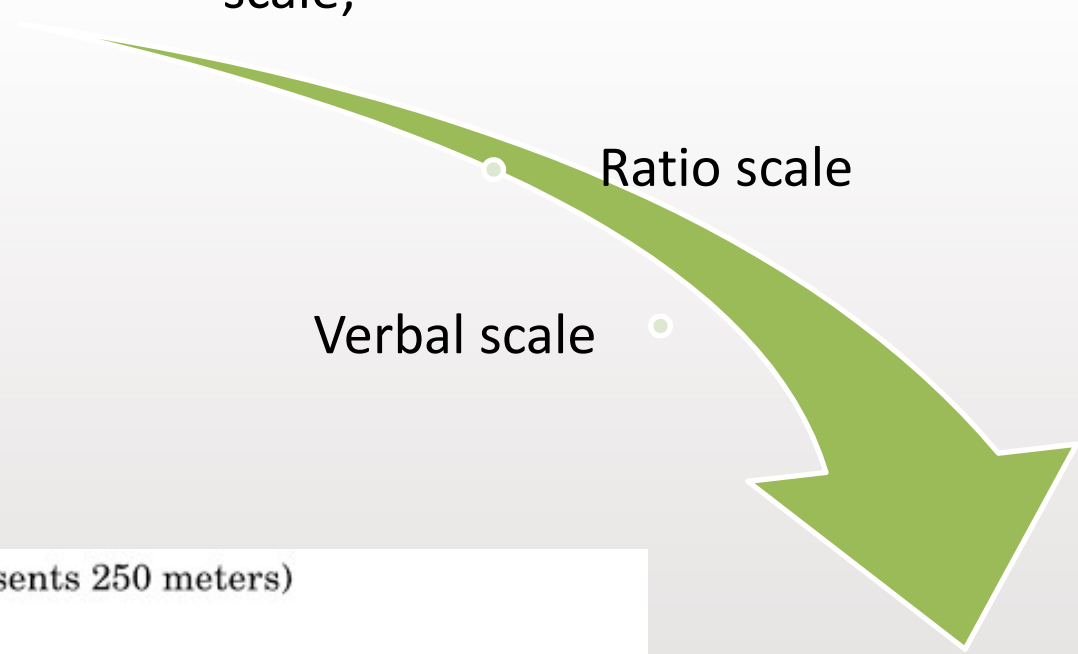

Scale: define as ratio of a distance on the map to the corresponding distance on the ground (Heywood et al, 2002)

Maps and spatial data;

2. Scale

Three type of scale;

Can you tell?

- a) (1 centimeter represents 250 meters)
- b) **1: 25 000**
- c)

Graphical scale

Maps and spatial data;

3. Spatial Entities

What is spatial entities?

An
object
in real
world

3 basic symbols type;

Point

Line

Polygon

Maps and spatial data;

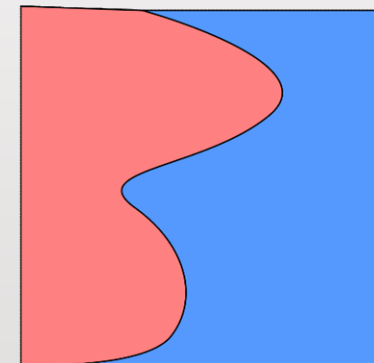

4. Generalization

Generalization:
simplification
of spatial
entities

1:500

1:10.000

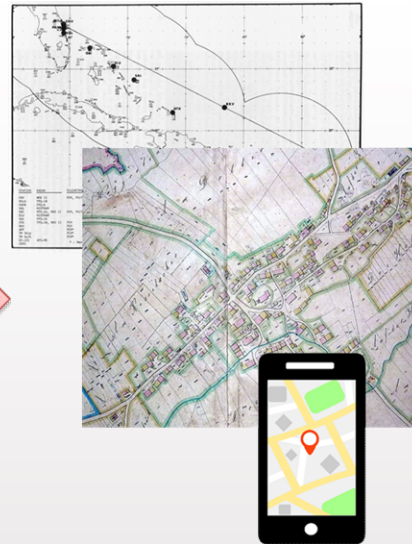

Maps and spatial data;

5. Projection

why?
how? who?
WHEN?
Where?

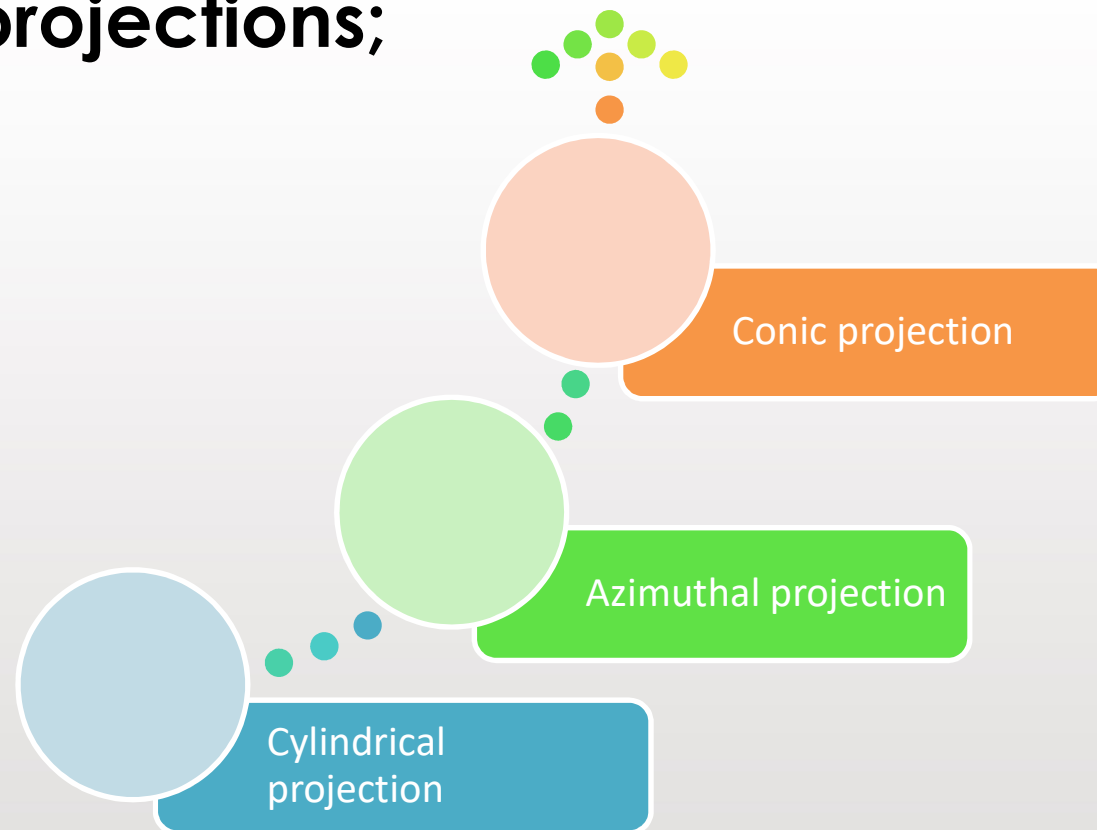

- Produce error
- Character change (based on projection used)
- Have distortion

Maps and spatial data;

5. Projection

- Type of projections;

Maps and spatial data;

6. Spatial Referencing

Used to locate features on earth's surface

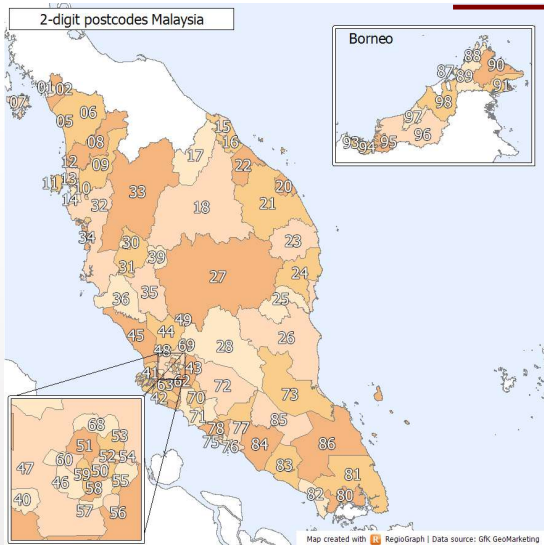

Need to show;

- Stability
- Ability to show features; point, line, and polygon
- Ability to measure; length, size, and shape

Maps and spatial data;

6. Spatial Referencing

Geographic coordinate system

Non-coordinate system

Have 3 main categories;

Rectangular coordinate system

Maps and spatial data;

7. Topology

- To describe the geometric characteristic of an objects

Point - Point	Point - Line	Point - Area
 is within nearest to	 on line nearest to	 in area on area
Line - Line	Line - Area	Area - Area
 intersect cross flow into	 intersect border	 overlap inside adjacent to

Figure 2.4 Topological Relationships Between Spatial Objects Source: Heywood et al, 2002

Maps and spatial data; 7. Topology

- **Other issues in topology?**
 - Road above road?
 - House below the apartment?
 - High rise housing?
 - How to model the topology?

Maps and spatial data; 7. Topology

HOW TO DO TOPOLOGY?

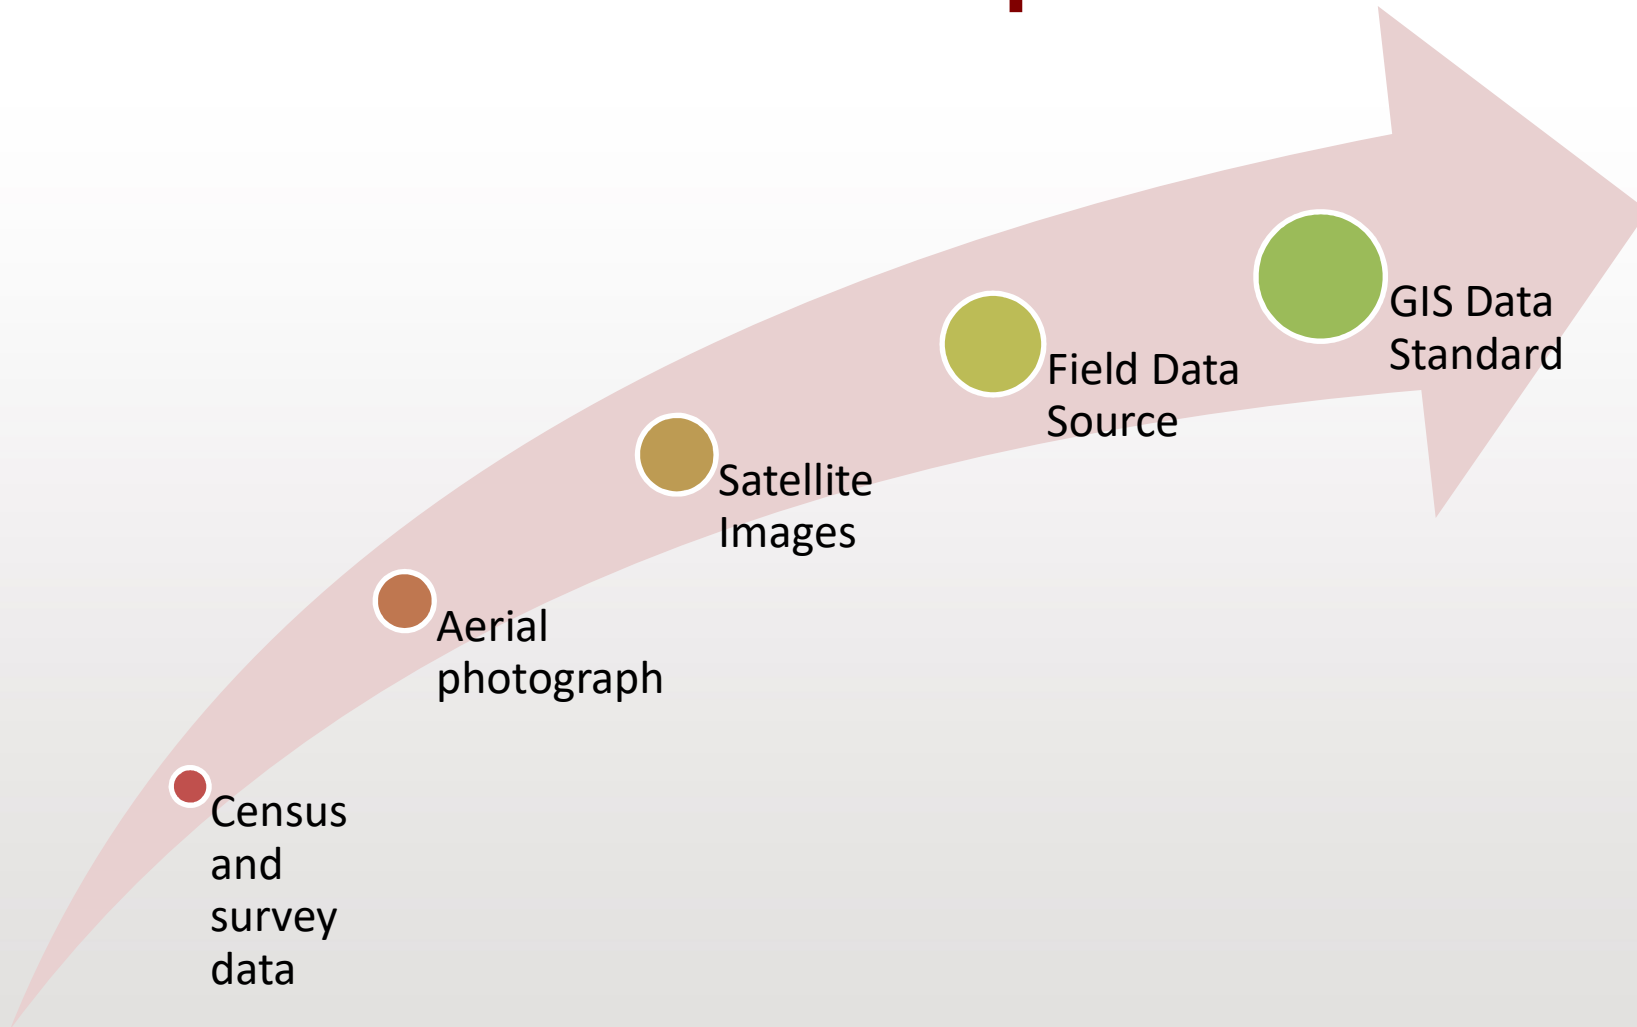

UTM ONLINE LEARNING

OTHER SOURCE OF SPATIAL DATA

Other sources of spatial data

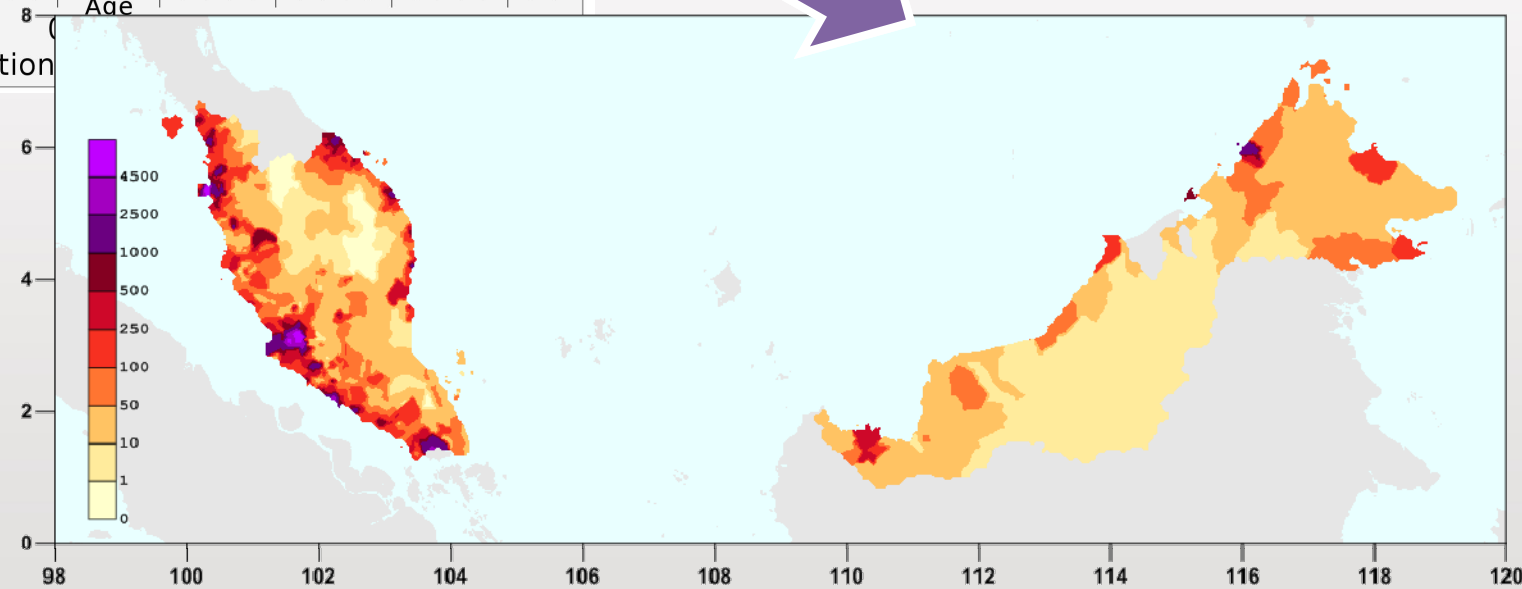

Other sources of spatial data

1. Census and Survey data

- If census and survey data have spatial reference, it allow the locations to be identified
- Example;
 - Population, employment data, agricultural, or marketing
 - For Election Boundaries

Population of Malaysia (2017)

Other sources of spatial data

2. Aerial Photograph/Unmanned Ariel Vehicle

- Snapshots of surface at certain time and place
- Usually use as background
- Can also used to analyse DSM and DTM

Other sources of spatial data

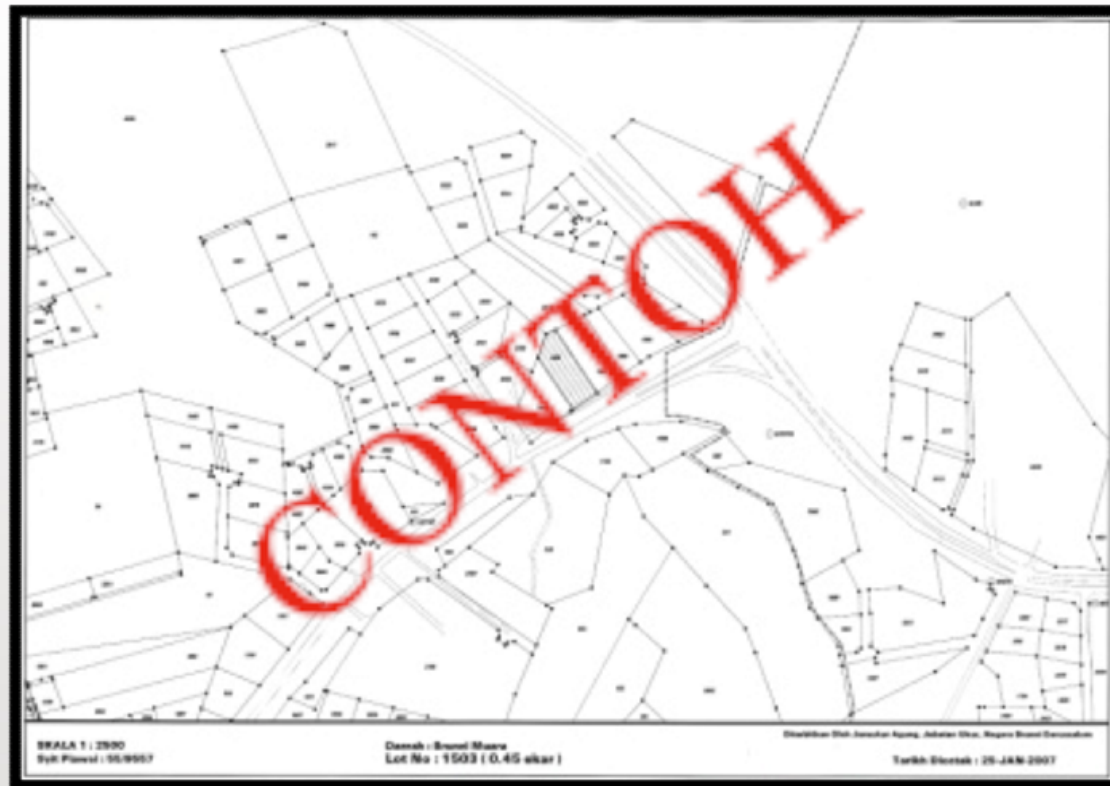

3. Satellite Images

- Capture by satellite, to produce the image
- Scale: image resolution
- Other sensor; thermal, hyperspectral, etc.

Other sources of spatial data

4. Field data source

- Data from field work, surveying, and GNSS

Other sources of spatial data

5. GIS data standard

- Need standardization to adapt between format
- OGC (Open Geospatial Consortium) Proposed GML (Geographic Mark-up Language)

```

146 #define dp_draw_wait
147 /// dp_draw_wait(text)
148 // Draws the "waiting" spinner
149 var w, h;
150 w = window_get_width()
151 h = window_get_height()
152 d3d_set_projection_ortho(0, 0, w, h, 0)
153 draw_set_color(c_white)
154 draw_circle_color(w / 2, h / 2, point_distance(0, 0, w / 2, h / 2) * 1.1,
155     $303030, $202020, false)
156 d3d_transform_stack_push()
157 {
158     d3d_transform_add_rotation_z(dp_elapsed() * 45)
159     d3d_transform_add_translation(w / 2, h / 2, 0)
160     d3d_model_draw(global.dp_waiting, 0, 0, 0, -1)
161 }
162 d3d_transform_stack_pop()
163 dp_draw_text(w / 2, h / 2, argument0)
    
```

Different format can be used if using the same standard

Conclusion

This topic identified three main dimensions of data, and how the different data sources portray the spatial dimension.

Besides that, this topic review the characteristic of map influence spatial data

GIS data model will be influence by spatial data used
